

# How prepared is your organization for a Windows 10 Migration?

The pressure is on for IT organizations to migrate to Windows 10. Microsoft stopped providing mainstream support for Windows 7 as of January 2015. A growing number of employees are installing Windows 10 on their personal devices and are in need of immediate access to core business applications.

Migrating to Microsoft's latest operating system is vital to ensuring your organization stays relevant and current; but this move presents a number of ongoing challenges including business disruptions, application incompatibilities and a time-consuming testing process. **Check your readiness now and discover if your IT organization has what it takes to make the move.**

## Windows 10 Migration Checklist:

- Do you need an effective strategy to deliver Windows 10 to the wide variety of Windows and non-Windows devices your employees use?
- Will you install and test every business application manually, one by one?
- Would employees want to try Windows 10 before it is installed?
- Do increasingly diverse endpoints add layers of complexity to the migration process?
- Do you need to deploy Windows 10 across widely distributed office locations?
- Are you concerned about productivity loss during your Windows 10 migration?
- Do you anticipate supporting multiple Windows operating systems within your organization?
- Are you concerned some of your critical business applications will not be compatible with Windows 10?
- Do your employees need access to older versions of Windows applications on their Windows 10 devices?
- Is delivering immediate, secure access to business apps on Windows 10 devices a top priority?

### Migrating to Windows 10 doesn't have to be an IT headache.

If you answered yes to any of these questions, a desktop virtualization solution could help you accelerate and simplify Windows 10 adoption. Virtualizing enables you to:

- ✓ Deliver instant access to business applications and Windows 10 desktops on any device, from anywhere.
- ✓ Provide access to centrally managed apps to employees with Windows 10 devices and avoid OS compatibility issues.
- ✓ Automate app compatibility testing to find out which applications built for Windows 7, Windows 8, or Windows XP are compatible with Windows 10.
